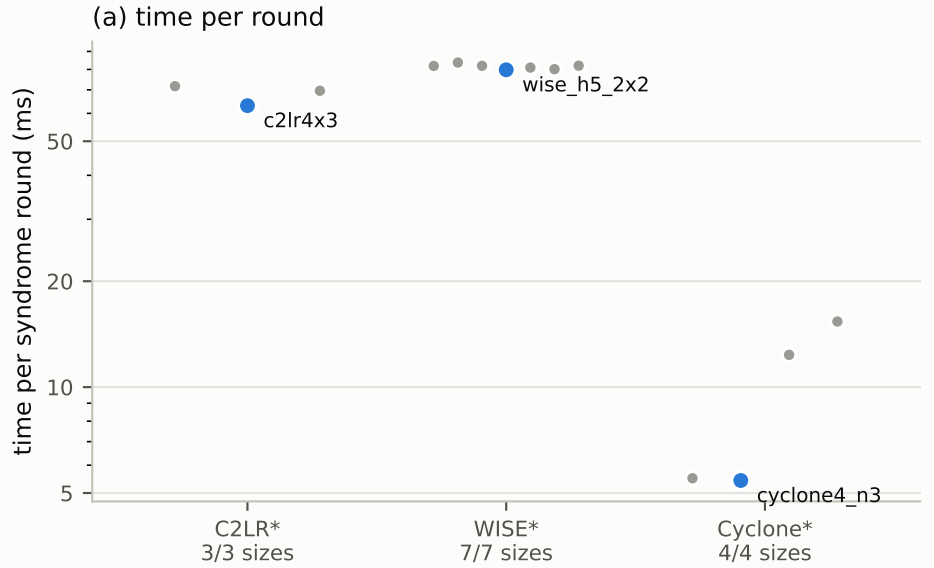
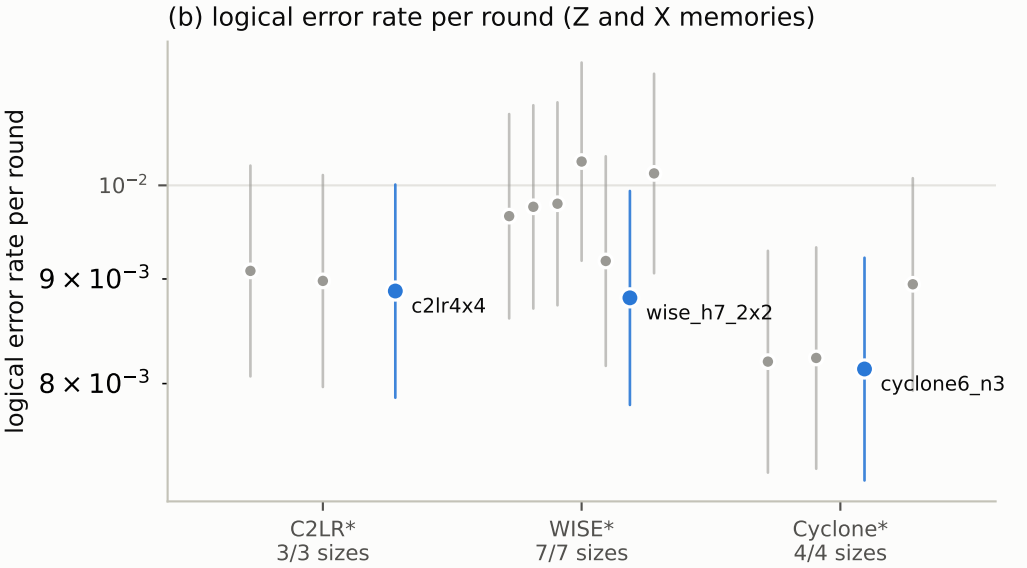
6.6.6 colour code [[7,1,3]], 3 rounds, 10 ions





* C2LR: enter and exit are the platform's reading of the deck's open S11; a merge and split around each gate are priced from the noise model, which marks that open for C2LR
* WISE: a baseline router, not the paper's worst-case sort; no qubit rests on a junction zone, so a chip holds h, not h + 1, qubits per cell
* Cyclone: keeps the circuit's gate order, so a round takes more than the paper's 2 rotations; cooling takes no time, as the deck's S10 assumes
